

128M x 64 Bit (1GB) 204-Pin DDR3 Small-Outline Unbuffered DIMM (PC3-10600) 1 Rank x 8; RoHS-6 Compliant

GENERAL DESCRIPTION

The SL64F8W128M8L-A15LTG is a 128M x 64 bit (1GB) 204-pin Double Data Rate 3 (DDR3) Small-Outline Unbuffered Dual In-Line Memory Module (SO-UDIMM).

The module consists of eight CMOS 16M x 8 bit x 8 bank DDR3 SDRAMs in lead-free BGA packages mounted in 1 rank on a 204-pin glass epoxy substrate.

A serial EEPROM using the two pin I²C protocol is also mounted to provide the Serial Presence Detects (SPD). Decoupling capacitors are mounted across the power supply. Damping resistors are added in series for DQ, DQS and DM signals.

The module has gold edge connections and is intended for mounting into XXX-pin ((CONFIG)) edge connector sockets keyed for 1.5V.

FEATURES

- PC3-10600 Compliant (DDR3-1333 667MHz-1.5ns@CL-^tRCD-^tRP: 9-9-9)
- 204-Pin SO-UDIMM form factor
- Average Periodic Refresh Interval (^tREFI)
 - 7.8125ms Max for 0°C < T_C < 85°C (64ms/8,196 cycles)
 - 3.9ms Max for 85°C < T_C < 95°C (32ms/8,196 cycles)
- V_{DD} = V_{DDQ} = 1.5V ±0.075V
- V_{DDSPD} = 1.425V to 1.575V
- JEDEC Standard 1.5V I/O (SSTL_15 compatible)
- DDR3 Architecture: Two data accesses per clock cycle, differential clock inputs (CK, /CK), bidirectional differential data strobe (DQS, /DQS), Off-Chip Driver (OCD), Impedance Adjustment, Dynamic On-Die Termination (ODT), On-Chip Delay Locked Loop (DLL); Eight-bit prefetch architecture
- Commands entered on each rising CK edge; DQS-edge aligned with data for READs and center-aligned with data for WRITEs; DLL to align DQ and DQS transitions with CK
- Eight internal component banks for concurrent operation
- Asynchronous RESET Pin Support
- ZQ Calibration Support
- Concurrent Auto Precharge option is supported
- Data Mask (DM) for masking Write data
- Programmable Burst Lengths: 4 (Burst Chop) and 8 (Nibble Sequential and Interleave Mode)
- /CAS READ Latency (CL): 6, 7, 8, 9, 10
- /CAS WRITE Latency (CWL): 5, 6, 7 -^tCK
- Posted /CAS Additive Latency (AL): 0, CL-1, CL-2
- Adjustable Data-Output drive strength
- Serial Presence Detect (SPD) EEPROM
- Gold edge contacts
- RoHS-6 Compliant and Halogen Free

- Notes:
1. ZQ resistors are 240 Ohms +/-1% unless otherwise noted.
 2. DQ to I/O wiring may be changed within a byte.
 3. If a Thermal Sensor is not included in the alternate SPD, then a separate SPD and TS are required.
 4. Unused register inputs ODT1 and CKE1 have a 330 ohm resistor to ground.
 5. /S1, CKE1, and ODT1 are not connected.
 6. CK1 and /CK1 are terminated near card edge.

ABSOLUTE MAXIMUM RATINGS

Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages and temperatures for extended periods may affect device reliability.

T_A	Operating Temperature-Module, Ambient				
	Commercial Operating Temperature	0	70	$^{\circ}C$	
	Industrial Operating Temperature: (W) Option	N/A	N/A	$^{\circ}C$	

Notes:

- Case Temperature, T_C , is the surface temperature on the center/top side of the DRAM. Please refer to the JESD51.2 Standard for the measurement conditions.
- Case temperature range between $0^{\circ}C$ to $85^{\circ}C$ is the range which all DRAM specifications are supported.
- For case temperature ranges between $85^{\circ}C$ to $95^{\circ}C$, a doubling of the refresh commands in frequency to a 32ms period ($t_{REFI} = 3.9\mu s$) is required. To enter self-refresh mode at this temperature range, an EMRS command is required to change the internal refresh rate.

RECOMMENDED DC OPERATING CONDITIONSAll voltages referenced to V_{SS} .

Symbol	Parameter	Minimum	Nominal	Maximum	Units	Notes
V_{DD}	Supply Voltage	1.425	1.5	1.575	V	1
V_{DDQ}	I/O Supply Voltage	1.425	1.5	1.575	V	4
V_{REF}	I/O Reference Voltage	$0.49 \times V_{DDQ}$	$0.50 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	V	2
V_{TT}	I/O Termination Voltage (System)	$V_{REF} - 40$	V_{REF}	$V_{REF} + 40$	mV	3

Notes:

- V_{DD} and V_{DDQ} must track each other. V_{DDQ} must be less than or equal to V_{DD} .
- V_{REF} is expected to equal $V_{DDQ}/2$ of the transmitting device and to track variations in the DC level of the same. Peak-to-Peak noise (non-common mode) on V_{REF} may not exceed ± 1 percent of the DC value. Peak-to-Peak AC noise on V_{REF} may not exceed ± 2 percent of $V_{REF}(DC)$. This measurement is to be taken at the nearest V_{REF} bypass capacitor.
- V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} and must track variations in the DC level of V_{REF} .
- V_{DDQ} tracks with V_{DD} ; V_{DDL} tracks with V_{DD} .

INPUT ELECTRICAL CHARACTERISTICS AND OPERATING CONDITIONS**INPUT DC LOGIC LEVELS**

V_{ILdiff}	Differential Input Low Logic	-	-200	mV	
V_{IX}	Differential Cross-Point Voltage relative to $V_{DD}/2$	-150	150	mV	

Notes:

- For DQ and DM, $V_{REF} = V_{REFDQ}$. For input only pins except RESET, or $V_{REF} = V_{REFCA}$.
- The AC peak noise on V_{REF} may not allow V_{REF} to deviate from $V_{REF}(DC)$ by more than $\pm 1\% V_{DD}$ (approximately $\pm 15mV$ for reference).
- Approximately $V_{DD}/2 \pm 15mV$.

OUTPUT ELECTRICAL CHARACTERISTICS AND OPERATING CONDITIONS

AC OUTPUT LEVELS

Symbol	Parameter	Value	Units	Notes
$V_{OH(AC)}$	AC Output High Measurement Level (SR Output)	$V_{TT} + 0.1 \times V_{DDQ}$	V	1

$V_{OLdiff(DC)}$	AC Differential Output Low Measurement Level (SR Output)	$-0.2 \times V_{DDQ}$	V	2

Notes:

1. The swing of $\pm 0.1 \times V_{DDQ}$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40 ohms and an effective test load of 25 ohms to $V_{TT} = V_{DDQ}/2$.
2. The swing of $+0.2 \times V_{DDQ}$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40 ohms and an effective test load of 25 ohms to $V_{TT} = V_{DDQ}/2$ at each of the differential outputs.

IDD SPECIFICATIONS AND CONDITIONS

IDD specifications are tested after the device is properly initialized. Recommended Operating Temperature Range. $V_{DD} = +1.5V \pm 0.075V$, $V_{DDQ} = +1.5V \pm 0.075V$, $V_{DDL} = +1.5V \pm 0.075V$, $V_{REF} = V_{DDQ}/2$.

Input slew rate is specified by AC Parametric Test Conditions. IDD parameters are specified with ODT disabled. Data bus consists of DQ, DQS, and /DQS. IDD values must be met with all combinations of EMR bits 10 and 11.

Definitions for IDD Conditions:

- LOW is defined as $V_{IN} \leq V_{IL(AC)}$ (MAX).
- HIGH is defined as $V_{IN} \geq V_{IH(AC)}$ (MIN).
- STABLE is defined as inputs stable at a HIGH or LOW level.
- FLOATING is defined as inputs at $V_{REF} = V_{DDQ}/2$.
- SWITCHING is defined as inputs changing between HIGH and LOW every other clock cycle (once per two clocks) for *address and control signals*; also defined as inputs changing between HIGH and LOW every other data transfer (once per clock) for *DQ signals* not including masks or strobes.

MAXIMUM DDR3 IDD VALUES

Notes:

- For IDD0, IDD1, IDD4W, IDD5 and IDD7:

For a one rank module:

IDD n is calculated with the rank in IDD n .

For two rank modules:

- IDD0, IDD1, IDD4W, IDD4R, IDD5 and IDD7 are calculated with one rank in IDD n and one rank in IDD2N **and**
- IDD2P, IDD2Q, IDD2N, IDD3P, IDD3N and IDD6 are calculated with two ranks in IDD n .

For four rank modules:

- IDD0, IDD1, IDD4W, IDD4R, IDD5 and IDD7 are calculated with one rank in IDD n and one rank in IDD2N and two ranks in IDD2P, **and**
- IDD2P, IDD2Q, IDD2N, IDD3P, IDD3N and IDD6 are calculated with two ranks in IDD n and two ranks in IDD2P.

Where n = corresponding IDD condition listed in the Symbol column.

- Values shown for DDR2 SDRAM components only.
- Values will differ according to the DRAM parts used to manufacture the module.

- IDD values are calculated using worst-case specifications of currently available DRAMs from different manufacturers.

- For Industrial Operating Temperature Range:

When $T_C \leq 0^\circ\text{C}$:

- IDD2P and IDD3P_(Slow) must be derated by 4 percent
- IDD4R and IDD5W must be derated by 2 percent
- IDD6 and IDD7 must be derated by 7 percent

When $T_C \leq 85^\circ\text{C}$:

- IDD0, IDD1, IDD2N, IDD2Q, IDD3N, IDD3P_(Fast), IDD4R, IDD4W and IDD5W must be derated by 2 percent
- IDD2P must be derated by 20 percent
- IDD3P_(Slow) must be derated by 30 percent
- IDD6 must be derated by 80 percent (IDD6 will increase by this amount if $T_C < 85^\circ\text{C}$ and the 2x refresh option is still enabled)

SPEED BINS - DDR3-1333 *(continued)*

Recommended Operating Temperature Range; $V_{DDQ} = V_{DD} = 1.5V \pm 0.075V$

SPEED BIN NOTES

1. The CL and CWL settings result in $t_{CK(AVG).MIN}$ and $t_{CK(AVG).MAX}$ requirements. When selecting a $t_{CK(AVG)}$, both need to be fulfilled.
2. $t_{CK(AVG).MIN}$ limits. CAS Latency is not strictly analog; the data and strobe output are synchronized by the DLL. All possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard $t_{CK(AVG)}$ value (2.5, 1.875, 1.5 or 1.25 nanoseconds) when calculating CL [nCK] = $t_{AA}[ns]$, rounding up to the next 'supported CL'.
3. $t_{CK(AVG).MAX}$ limits: $t_{CK(AVG)} = t_{AA.MAX}/CL_{SELECTED}$, rounding the $t_{CK(AVG)}$ down to the next valid speed bin limit (3.3ns or 2.5ns, or 1.875ns or 1.25ns). This result is $t_{CK(AVG).MAX}$ corresponding to CL_{SELECTED}.
4. 'Reserved' settings are not allowed. The user must program a different value.
5. 'Optional' settings allow certain devices to support this setting, but it is not a mandatory feature. Refer to the datasheet of the supplier and SPD information to determine if and how this setting is supported.
6. Any DDR3 speed bin also supports functional operation at lower frequencies as indicated in the table but are verified by design only and not production tests.
7. t_{REFI} is dependent on T_C operating temperature (case temperature).

CLOCK JITTER NOTES

1. The unit, ' $t_{CK(avg)}$ ', represents the actual $t_{CK(avg)}$ of the input clock under operation; ' n_{CK} ' represents one clock cycle of the input clock, counting the actual clock edges.
2. These parameters are measured from a command/address signal (CKE, /CS, /RAS, /CAS, /WE ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal crossing. The specific values are not affected by the amount of clock jitter applied. The setup and hold are relative to the clock signal crossing that latches the command/address. These parameters should be met whether clock jitter is present or absent.
3. These parameters are measured from a data strobe signal crossing to its respective clock signal crossing. The specific values are not affected by the amount of clock jitter applied. The setup and hold are relative to the clock signal crossing that latches the command/address. These parameters should be met whether clock jitter is present or absent.
4. These parameters are measured from a data signal (DM(L/U), DQ(L/U)0, DQ(L/U)1, etc) transition edge to its respective data strobe signal (DQS(L/U)/DQS(L/U) crossing.
5. The DDR3 SDRAM device supports $t_{nPARM} [n_{CK}] = RU\{t_{PARM} [ns] / t_{CK(avg)}\}$, which is in clock cycles, with the assumption that all input clock jitter specifications are satisfied.
6. The parameters are specified per their average values; however, the relationship between the average timing and the absolute instantaneous timing holds at all times.

TIMING PARAMETER NOTES

- Actual values are dependent on measurement level definitions. TBD.
- READ (and RAP) and synchronous ODT commands require a locked DLL.
- The maximum values are dependent on the system.
- WR as programmed in the mode register.
- RTT Turn-On Time (t_{AON}) TBD.
- RTT Turn-Off Time (t_{AOF}) TBD.
- t_{WR} is in nanoseconds. To calculate t_{WRPDEN} , t_{WR}/t_{CK} must be rounded up to the next integer.
- WR is in clock cycles as programmed in MR0.
- The maximum postamble is bound by $t_{HZDQS(max)}$.
- Output timing deratings are relative to the SDRAM input clock. When the device operates with input clock jitter, the parameters need to be derated by TBD.
- The TBD value is only valid for RON34.
- TBD is a single-ended signal parameter.
- t_{REFI} is dependent on T_C .
- $t_{IS(base)}$ and $t_{IH(base)}$ values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, /CK differential slew rate. For DQ and DM signals, $V_{REF(DC)} = V_{REF}^{DQ(DC)}$. For input pins except RESET, $V_{REF(DC)} = V_{REF}^{CA(DC)}$.
- $t_{DS(base)}$ and $t_{DH(base)}$ values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, /DQS differential slew rate. For DQ and DM signals, $V_{REF(DC)} = V_{REF}^{DQ(DC)}$. For input pins except RESET, $V_{REF(DC)} = V_{REF}^{CA(DC)}$.
- The start of the internal write transaction is as follows:
 - For BL8 (fixed by MRS and on-the-fly): Rising clock edge 4 clock cycles after WL.
 - For BC4 (on-the-fly): Rising clock edge 4 clock cycles after WL.
 - For BC4 (fixed by MRS): Rising clock edge 2 clock cycles after WL.
- CKE is allowed to register LOW while operations such as row activation, precharge, autoprecharge, autoprecharge or refresh rate are in progress; however, the power-down IDD specification is not applied until such operations are completed.
- CKE is allowed to register LOW after a REFRESH command once $t_{REFPDEN(min)}$ is satisfied; however, there are situations where additional time such as $t_{XPDLL(min)}$ is also required.
- $t_{JIT(duty)} = +/-\{0.07 * t_{CK(avg)} - [p.5 - (\min(t_{CH(avg)}, t_{CL(avg)})) * t_{CK(avg)}]\}$. For example, if t_{CH}/t_{CL} was 0.48/0.52, t_{JIT} duty would calculate out to +/- 125ps. The values listed for $t_{CH(avg)}$ and $t_{CL(avg)}$ must not be exceeded.
